Object Oriented Programming
Fall 2011
Homework # 11
Iterators
Due date Jan 4th 2012

Derive a new class from the templated PFArray class of Savitch so that your new class can return
- a forward iterator
- a reverse iterator

The operators that should work on the iterators are ++, - -, = =, !=, *, →

The new class should also have any other function and inner classes for these iterators.

Test your new iterators with all the new functions and operators.

Notes:
- You should strictly follow the homework submission details and email your homework to the TA.
- Your program should use the OO principles.
